DETDESC:

DETD(4)

In the embodiment of the interconnected **surgical** sponges shown in FIGS. 1 and 2, the linear connector 22 is an absorbent relatively flat ribbon or tape, such as . . . folded in a zig-zag pattern having relatively flat folds 40, as best shown in FIG. 2. As described above, the **sponge** is preferably fixed to the ribbon adjacent one edge, as at 28. In this embodiment, the periphery of the **sponge** is stitched, such as by a conventional hemming stitch, which retains the ribbon at 28 and further retains the indicator tab 32. In the disclosed embodiment, the indicator tab includes an **indicia** 5 to identify the location of the particular **sponge** in the string. The number will notify the surgeon when he is approaching the end of the string, permitting the surgeon to call for another package of **surgical** sponges. Similarly, the indicator tabs may be colored either to identify the location of the **surgical sponge** or to differentiate between different packages of sponges. An identification number may also be printed directly upon the **surgical sponge**. The identification tab may also be utilized in conjunction with a counter system, wherein a counter is disposed with the **sponge** to make certain that each of the sponges has been removed from the incision.
